There are 8 questions in this question paper. The total mark for this paper is 75.

Advice to Candidates

You must ensure that your answers to parts of questions are clearly labelled.
You must show sufficient working to make your methods clear to the Examiner.
Answers without working may not gain full credit.

4.

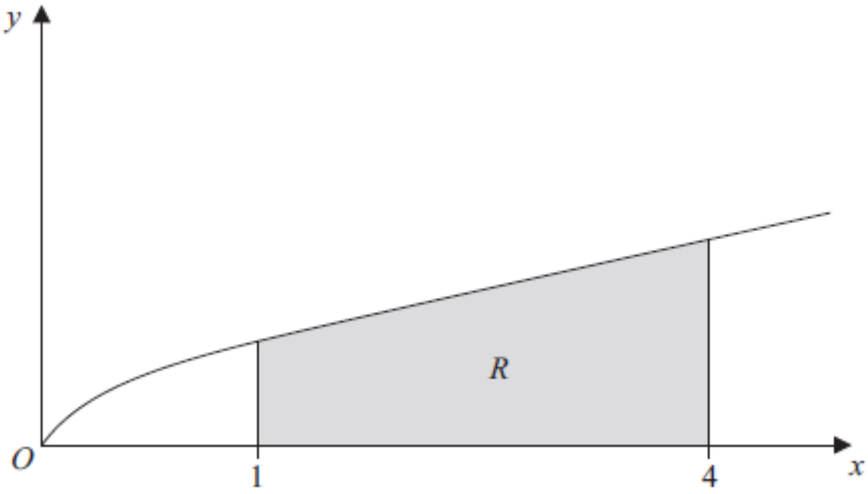

Figure 1

Figure 1 shows a sketch of part of the curve with equation $y = \frac{x}{1+\sqrt{x}}$. The finite region R, shown shaded in Figure 1, is bounded by the curve, the x-axis, the line with equation $x = 1$ and the line with equation $x = 4$.

(*a*) Copy and complete the table with the value of y corresponding to $x = 3$, giving your answer to 4 decimal places.

(1)

x	1	2	3	4
y	0.5	0.8284		1.3333

(*b*) Use the trapezium rule, with all the values of y in the completed table, to obtain an estimate of the area of the region R, giving your answer to 3 decimal places.

(3)

(*c*) Use the substitution $u = 1 + \sqrt{x}$, to find, by integrating, the exact area of R.

(8)

5.

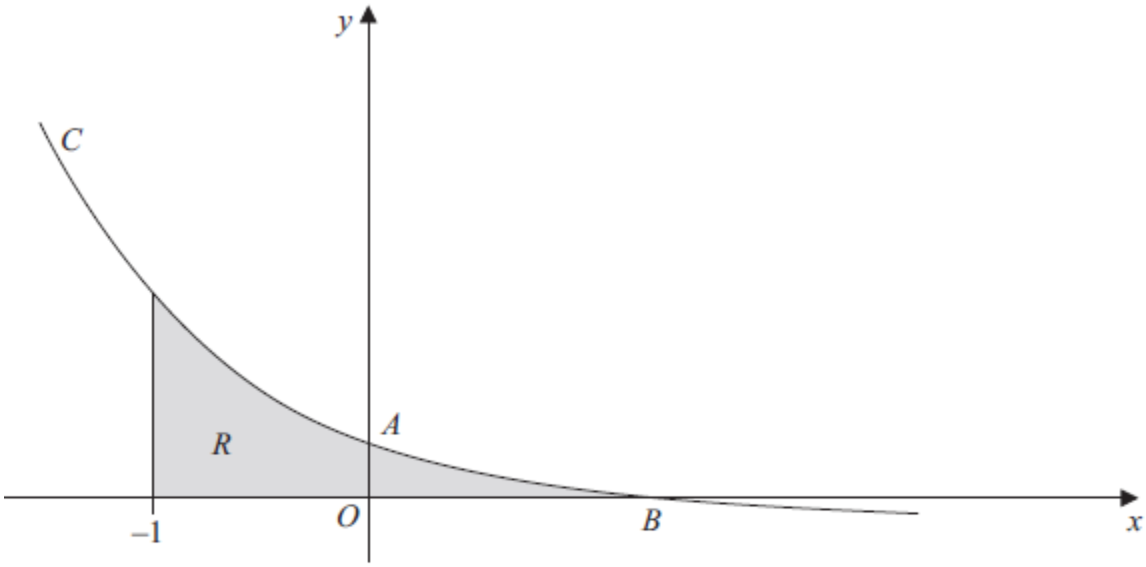

Figure 2

Figure 2 shows a sketch of part of the curve C with parametric equations

$$x = 1 - \frac{1}{2}t, \qquad y = 2^t - 1.$$

The curve crosses the y-axis at the point A and crosses the x-axis at the point B.

(*a*) Show that A has coordinates (0, 3).

(2)

(*b*) Find the x-coordinate of the point B.

(2)

(*c*) Find an equation of the normal to C at the point A.

$$l_2 : \mathbf{r} = (2\mathbf{i} - \mathbf{j} + \mathbf{k}) + \mu(2\mathbf{i} + \mathbf{j} + \mathbf{k})$$

where λ and μ are scalar parameters.

(*a*) Given that l_1 and l_2 meet, find the position vector of their point of intersection.

(5)

(*b*) Find the acute angle between l_1 and l_2, giving your answer in degrees to 1 decimal place.

(3)

Given that the point A has position vector $4\mathbf{i} + 16\mathbf{j} - 3\mathbf{k}$ and that the point P lies on l_1 such that AP is perpendicular to l_1,

(*c*) find the exact coordinates of P.

8. A bottle of water is put into a refrigerator. The temperature inside the refrigerator remains constant at 3 °C and t minutes after the bottle is placed in the refrigerator the temperature of the water in the bottle is θ °C.

The rate of change of the temperature of the water in the bottle is modelled by the differential equation

$$\frac{\mathrm{d}\theta}{\mathrm{d}t} = \frac{(3-\theta)}{125}.$$

(*a*) By solving the differential equation, show that

$$\theta = A\mathrm{e}^{-0.008t} + 3,$$

where A is a constant.

(4)

Given that the temperature of the water in the bottle when it was put in the refrigerator was 16 °C,

(*b*) find the time taken for the temperature of the water in the bottle to fall to 10 °C, giving your answer to the nearest minute.

3.	**Method 1: Using one identity**		
	$\frac{9x^2+20x-10}{(x+2)(3x-1)} \equiv A + \frac{B}{(x+2)} + \frac{C}{(3x-1)}$		
	$A = 3$	their constant term $= 3$	B1
	$9x^2 + 20x - 10 \equiv A(x+2)(3x-1) + B(3x-1) + C(x+2)$	Forming a correct identity.	B1
	Either $x^2:\ 9 = 3A\ ,\quad x:\ 20 = 5A + 3B + C$ constant: $-10 = -2A - B + 2C$ or $x = -2 \Rightarrow 36 - 40 - 10 = -7B \Rightarrow -14 = -7B \Rightarrow B = 2$	Attempts to find the value of either one of their B or their C from their identity.	M1
	$x = \frac{1}{3} \Rightarrow 1 + \frac{20}{3} - 10 = \frac{7}{3}C \Rightarrow -\frac{7}{3} = \frac{7}{3}C \Rightarrow C = -1$	Correct values for their B and their C, which are found using a correct identity.	A1
			[4]
	Method 2: Long Division		
	$\frac{9x^2+20x-10}{(x+2)(3x-1)} \equiv 3 + \frac{5x-4}{(x+2)(3x-1)}$	their constant term $= 3$	B1
	So, $\frac{5x-4}{(x+2)(3x-1)} \equiv \frac{B}{(x+2)} + \frac{C}{(3x-1)}$		
	$5x - 4 \equiv B(3x-1) + C(x+2)$	Forming a correct identity.	B1
	Either $x:\ 5 = 3B + C$, constant: $-4 = -B + 2C$ or $x = -2 \Rightarrow -10 - 4 = -7B \Rightarrow -14 = -7B \Rightarrow B = 2$	Attempts to find the value of either one of their B or their C from their identity.	M1
	$x = \frac{1}{3} \Rightarrow \frac{5}{3} - 4 = \frac{7}{3}C \Rightarrow -\frac{7}{3} = \frac{7}{3}C \Rightarrow C = -1$	Correct values for their B and their C, which are found using $5x - 4 \equiv B(3x-1) + C(x+2)$	A1
	So, $\frac{9x^2+20x-10}{(x+2)(3x-1)} \equiv 3 + \frac{2}{(x+2)} - \frac{1}{(3x-1)}$		**[4]**

1st **B1:** Their constant term must be equal to 3 for this mark.
2nd **B1 (M1 on epen):** Forming a correct identity. This can be implied by later working.
M1 (A1 on epen): Attempts to find the value of either one of their B or their C from their identity. This can be achieved by ***either*** substituting values into their identity ***or*** comparing coefficients and solving the resulting equations simultaneously.
A1: Correct values for their B and their C, which are found using a correct identity.
Note : $\frac{9x^2+20x-10}{(x+2)(3x-1)} \equiv \frac{A}{(x+2)} + \frac{B}{(3x-1)}$, leading to $9x^2 + 20x - 10 \equiv A(3x-1) + B(x+2)$, leading to $A = 2$ and $B = -1$ will gain a maximum of B0B0M1A0

.

3. ctd

Note: You can imply the 2nd B1 from either $\dfrac{9x^2 + 20x - 10}{(x + 2)(3x - 1)} \equiv \dfrac{A(x+2)(3x-1) + B(3x-1) + C(x+2)}{(x + 2)(3x - 1)}$

or $\dfrac{5x - 4}{(x + 2)(3x - 1)} \equiv \dfrac{B(3x-1) + C(x+2)}{(x + 2)(3x - 1)}$

Alternative Method 1: Initially dividing by (x + 2)

$$\frac{9x^2 + 20x - 10}{"(x + 2)"(3x - 1)} \equiv \frac{9x + 2}{(3x - 1)} - \frac{14}{(x + 2)(3x - 1)}$$

$$\equiv 3 + \frac{5}{(3x - 1)} - \frac{14}{(x + 2)(3x - 1)}$$

B1: their constant term = 3

So, $\dfrac{-14}{(x + 2)(3x - 1)} \equiv \dfrac{B}{(x + 2)} + \dfrac{C}{(3x - 1)}$

$-14 \equiv B(3x-1) + C(x+2)$

B1: Forming a correct identity.

$\Rightarrow B = 2, C = -6$

M1: Attempts to find either one of their *B* or their *C* from their identity.

So, $\dfrac{9x^2 + 20x - 10}{(x + 2)(3x - 1)} \equiv 3 + \dfrac{5}{(3x - 1)} + \dfrac{2}{(x + 2)} - \dfrac{6}{(3x - 1)}$

and $\dfrac{9x^2 + 20x - 10}{(x + 2)(3x - 1)} \equiv 3 + \dfrac{2}{(x + 2)} - \dfrac{1}{(3x - 1)}$

A1: Correct answer in partial fractions.

Alternative Method 2: Initially dividing by (3x - 1)

$$\frac{9x^2 + 20x - 10}{(x + 2)"(3x - 1)"} \equiv \frac{3x + \frac{23}{3}}{(x + 2)} - \frac{\frac{7}{3}}{(x + 2)(3x - 1)}$$

$$\equiv 3 + \frac{\frac{5}{3}}{(x + 2)} - \frac{\frac{7}{3}}{(x + 2)(3x - 1)}$$

B1: their constant term = 3

So, $\dfrac{-\frac{7}{3}}{(x + 2)(3x - 1)} \equiv \dfrac{B}{(x + 2)} + \dfrac{C}{(3x - 1)}$

$-\frac{7}{3} \equiv B(3x-1) + C(x+2)$

B1: Forming a correct identity.

$\Rightarrow B = \dfrac{1}{3}, C = -1$

M1: Attempts to find either one of their *B* or their *C* from their identity.

So, $\dfrac{9x^2 + 20x - 10}{(x + 2)(3x - 1)} \equiv 3 + \dfrac{\frac{5}{3}}{(x + 2)} + \dfrac{\frac{1}{3}}{(x + 2)} - \dfrac{1}{(3x - 1)}$

and $\dfrac{9x^2 + 20x - 10}{(x + 2)(3x - 1)} \equiv 3 + \dfrac{2}{(x + 2)} - \dfrac{1}{(3x - 1)}$

A1: Correct answer in partial fractions.

B1: $\frac{\mathrm{d}u}{\mathrm{d}x}=\frac{1}{2}x^{-\frac{1}{2}}$ or $\mathrm{d}u=\frac{1}{2\sqrt{x}}\,\mathrm{d}x$ or $2\sqrt{x}\,\mathrm{d}u=\mathrm{d}x$ or $\mathrm{d}x=2(u-1)\mathrm{d}u$ or $\frac{\mathrm{d}x}{\mathrm{d}u}=2(u-1)$ oe.

1st M1: $\frac{x}{1+\sqrt{x}}$ becoming $\frac{(u-1)^2}{u}$ (Ignore integral sign).

1st A1 (B1 on epen): $\frac{x}{1+\sqrt{x}}\,\mathrm{d}x$ becoming $\frac{(u-1)^2}{u}.\,2(u-1)\{\mathrm{d}u\}$ or $\frac{(u-1)^2}{u}.\,\frac{2}{(u-1)^{-1}}\{\mathrm{d}u\}$.

You can ignore the integral sign and the $\mathrm{d}u$.

2nd M1: Expands to give a "four term" cubic in u, $\pm Au^3 \pm Bu^2 \pm Cu \pm D$
where $A\neq 0$, $B\neq 0$, $C\neq 0$ and $D\neq 0$ The cubic does not need to be simplified for this mark.

3rd M1: An attempt to divide at least three terms in ***their cubic*** by u.
Ie. $\frac{(u^3-3u^2+3u-1)}{u} \to u^2-3u+3-\frac{1}{u}$

2nd A1: $\int\frac{(u-1)^3}{u}\,\mathrm{d}u \to \left(\frac{u^3}{3}-\frac{3u^2}{2}+3u-\ln u\right)$

4th M1: Some evidence of limits of 3 and 2 in u and subtracting either way round.

3rd A1: Exact answer of $\frac{11}{3}+2\ln 2-2\ln 3$ or $\frac{11}{3}+2\ln\left(\frac{2}{3}\right)$ or $\frac{11}{3}-\ln\left(\frac{9}{4}\right)$ or $2\left(\frac{11}{6}+\ln 2-\ln 3\right)$
or $\frac{22}{6}+2\ln\left(\frac{2}{3}\right)$, etc. **Note**: that fractions must be combined to give either $\frac{11}{3}$ or $\frac{22}{6}$ or $3\frac{2}{3}$

Alternative method for 2nd M1 and 3rd M1 mark

$$\{2\}\int\frac{(u-1)^2}{u}.\,(u-1)\,\mathrm{d}u = \{2\}\int\frac{(u^2-2u+1)}{u}.\,(u-1)\,\mathrm{d}u$$

$$= \{2\}\int\left(u^2-3u+3-\frac{1}{u}\right)\,\mathrm{d}u$$

An attempt to expand $(u-1)^2$, then divide the result by u and then go on to multiply by $(u-1)$. **2nd M1**

to give three out of four of $\pm Au^2$, $\pm Bu$, $\pm C$ or $\pm\frac{D}{u}$ **3rd M1**

M1: Applies limits of 4 and 1 in x and subtracts either way round.

$$= \left(18 - 27 + 18 - 2\ln 3\right) - \left(\frac{16}{3} - 12 + 12 - 2\ln 2\right)$$

$$= \frac{11}{3} + 2\ln 2 - 2\ln 3 \quad \text{or} \quad \frac{11}{3} + 2\ln\left(\frac{2}{3}\right) \quad \text{or} \quad \frac{11}{3} - \ln\left(\frac{9}{4}\right), \text{ etc}$$

$$= \frac{(u-1)^4}{4u} + \frac{1}{4}\int \frac{u^4 - 4u^3 + 6u^2 - 4u + 1}{u^2}\,\mathrm{d}u$$

M1: Applies integration by parts and expands to give a five term quartic.

$$= \frac{(u-1)^4}{4u} + \frac{1}{4}\int u^2 - 4u + 6 - \frac{4}{u} + \frac{1}{u^2}\,\mathrm{d}u$$

M1: Dividing at least 4 terms.

$$= \frac{(u-1)^4}{4u} + \frac{1}{4}\left(\frac{u^3}{3} - 2u^2 + 6u - 4\ln u - \frac{1}{u}\right)$$

A1: Correct Integration.

$$\int_2^3 \frac{(u-1)^3}{u}\,\mathrm{d}u = \left[\frac{(u-1)^4}{4u} + \frac{u^3}{12} - \frac{u^2}{2} + \frac{3u}{2} - \ln u - \frac{1}{4u}\right]_2^3$$

$$\text{Area}(R) = 2\int_2^3 \frac{(u-1)^3}{u}\,\mathrm{d}u = 2\left(\frac{11}{6} + \ln\frac{2}{3}\right)$$

This can be implied by $\cos^2 x=\frac{1+\cos 2x}{2}$ or $4\cos^2 x\rightarrow 2+2\cos 2x$ or $\cos 2A=2\cos^2 A-1$.

Do not worry about the signs when integrating $\cos x$ or $\cos 2x$ for this mark.

Note: $\int(1-2\cos x)^2=\int 1+4\cos^2 x$ is ok for an attempt at $\int y^2$.

7. (a)

M1: Writes down any two equations. Allow one slip.

dM1: Attempts to eliminate either λ or μ to form an equation in one parameter only.

A1: For either $\lambda = -3$ or $\mu = 2$. **Note**: candidates only need to find one of the parameters.

ddM1: For either substituting their value of λ into l_1 or their μ into l_2.

2$^{\text{nd}}$ A1: For either $\begin{pmatrix} 6 \\ 1 \\ 3 \end{pmatrix}$ or $6\mathbf{i} + \mathbf{j} + 3\mathbf{k}$ or $\begin{pmatrix} 6 & 1 & 3 \end{pmatrix}$.

Note: Each of the method marks in this part are dependent upon the previous method marks.

(b)

M1: Realisation that the dot product is required between $\pm A\mathbf{d}_1$ and $\pm B\mathbf{d}_2$. Allow one slip in $\mathbf{d}_1 = \mathbf{i} + 4\mathbf{j} - 2\mathbf{k}$.

A1: Correct application of the dot product formula $\mathbf{d}_1 \bullet \mathbf{d}_2 = \pm |\mathbf{d}_1||\mathbf{d}_2|\cos\theta$ or $\cos\theta = \pm\left(\dfrac{\mathbf{d}_1 \bullet \mathbf{d}_2}{|\mathbf{d}_1||\mathbf{d}_2|}\right)$

The dot product must be correctly applied and the square roots although they can be un-simplified must be correctly applied.

A1: awrt 69.1 . This can be also be achieved by $180 - 110.876 = \text{awrt } 69.1$. $\theta = 1.2064...^c$ is A0.

Common response: $\cos\theta = \left(\dfrac{-12-24+12}{\sqrt{(-3)^2+(-12)^2+(6)^2}.\sqrt{(4)^2+(2)^2+(2)^2}}\right) = \dfrac{-24}{\sqrt{189}.\sqrt{24}}$ is M1A1...

<u>Alternative Method: Vector Cross Product</u>

Only apply this scheme if it is clear that a candidate is applying a vector cross product method.

$$\mathbf{d}_1 \times \mathbf{d}_2 = \underline{\begin{pmatrix} 1 \\ 4 \\ -2 \end{pmatrix} \times \begin{pmatrix} 2 \\ 1 \\ 1 \end{pmatrix}} = \left\{ \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 1 & 4 & -2 \\ 2 & 1 & 1 \end{vmatrix} = 6\mathbf{i} - 5\mathbf{j} - 7\mathbf{k} \right\}$$

<u>M1</u>: Realisation that the vector cross product is required between $\pm A\mathbf{d}_1$ and $\pm B\mathbf{d}_2$. Allow one slip in $\mathbf{d}_1 = \mathbf{i} + 4\mathbf{j} - 2\mathbf{k}$.

$$\sin\theta = \frac{\sqrt{(6)^2+(5)^2+(-7)^2}}{\sqrt{(1)^2+(4)^2+(-2)^2}.\sqrt{(2)^2+(1)^2+(1)^2}}$$

A1: Correct applied **equation**.

$$\sin\theta = \frac{\sqrt{110}}{\sqrt{21}.\sqrt{6}} \Rightarrow \theta = 69.1238974... = 69.1 \text{ (1 dp)}$$

A1: awrt 69.1

(c)

M1: Attempts to find $\overrightarrow{AP}$ in terms of the parameter by subtracting the components of $\overrightarrow{OP}$ from l_1 and $\overrightarrow{OA}$. Ignore the direction of subtraction and ignore any confusion between $\overrightarrow{OP}$ and $\overrightarrow{PO}$ or between $\overrightarrow{OA}$ and $\overrightarrow{AO}$. The correct subtraction of two components is enough to establish that subtraction is intended. The coordinates or position vector of P must be given in terms of a parameter. Taking $P:(x, y, z)$ gains no marks although this can be recovered later. See **Additional Solutions**.

A1: (M1 on epen) A correct expression for $\overrightarrow{AP}$. Again accept the reverse direction.

dM1: Depends on the previous M. Taking the scalar product of their expression for $\overrightarrow{AP}$ with $\mathbf{d}_1$ or a multiple of $\mathbf{d}_1$ and equating to 0 and obtaining an equation for λ. The equation must derive from an expression of the form $x_1x_2 + y_1y_2 + z_1z_2 = 0$. Differentiation can be used. See **Additional Solutions**.

A1: Solving to find $\lambda = \frac{1}{3}$.

ddM1: Depends on both previous Ms. Substitutes their value of the parameter into their expression for $\overrightarrow{OP}$. Substituting into $\overrightarrow{AP}$ is a common error which loses the mark.

Note: Needs 2 correct co-ordinates if $\lambda = \frac{1}{3}$ found and then P stated without method to gain ddM1.

	A1: $9\frac{1}{3}\mathbf{i}+14\frac{1}{3}\mathbf{j}-3\frac{2}{3}\mathbf{k}$. Accept vector notation or coordinates. ***Must be exact.***

7. (c)

Additional Solution 1:

Taking $\overrightarrow{OP} = \begin{pmatrix} x \\ y \\ z \end{pmatrix}$, in itself, can gain no marks but this may be converted to a parameter at a later stage in the solution and, at that stage, any relevant marks can be awarded.

For example, $\overrightarrow{AP} = \begin{pmatrix} x \\ y \\ z \end{pmatrix} - \begin{pmatrix} 4 \\ 16 \\ -3 \end{pmatrix} = \begin{pmatrix} x-4 \\ y-16 \\ z+3 \end{pmatrix}$

leading to: $\begin{pmatrix} x-4 \\ y-16 \\ z+3 \end{pmatrix} \square \begin{pmatrix} 1 \\ 4 \\ -2 \end{pmatrix} = x - 4 + 4y - 64 - 2z - 6 = 0$ No marks gained at this stage.

Using, $\overrightarrow{OP} = \begin{pmatrix} 9 \\ 13 \\ -3 \end{pmatrix} + \lambda \begin{pmatrix} 1 \\ 4 \\ -2 \end{pmatrix} = \begin{pmatrix} 9+\lambda \\ 13+4\lambda \\ -3-2\lambda \end{pmatrix}$ on $x + 4y - 2z = 74$

which gives: $9 + \lambda + 4(13 + 4\lambda) - 2(-3 - 2\lambda) = 74$ At this stage award **M1A1** and **dM1** (which is implied by an equation)

$\Rightarrow \; 21\lambda + 67 = 74 \Rightarrow \underline{\lambda = \frac{1}{3}}$ A1: Solving to find $\lambda = \frac{1}{3}$.

Position vector

$\overrightarrow{OP} = \begin{pmatrix} 9 \\ 13 \\ -3 \end{pmatrix} + \frac{1}{3}\begin{pmatrix} 1 \\ 4 \\ -2 \end{pmatrix} = \begin{pmatrix} 9\frac{1}{3} \\ 14\frac{1}{3} \\ -3\frac{2}{3} \end{pmatrix}$ or $\begin{pmatrix} \frac{28}{3} \\ \frac{43}{3} \\ -\frac{11}{3} \end{pmatrix}$ ddM1 A1

Additional Solution 2: Using Differentiation

$\overrightarrow{AP} = \begin{pmatrix} 9+\lambda \\ 13+4\lambda \\ -3-2\lambda \end{pmatrix} - \begin{pmatrix} 4 \\ 16 \\ -3 \end{pmatrix} = \begin{pmatrix} \lambda+5 \\ 4\lambda-3 \\ -2\lambda \end{pmatrix}$ **M1A1:** As main scheme

$AP^2 = (\lambda + 5)^2 + (4\lambda - 3)^2 + (-2\lambda)^2 = \{21\lambda^2 - 14\lambda + 34\}$

$\frac{\mathrm{d}}{\mathrm{d}\lambda}\left(AP^2\right) = 42\lambda - 14 = 0$ **M1**

leading to $\lambda = \frac{1}{3}$ **A1:** Solving to find $\lambda = \frac{1}{3}$.

... then apply the main scheme.
